# Table of Contents

# EtherChannel Between Catalyst 3550/3750 Series Switches and Catalyst Switches Running Cisco IOS System Software Configuration Example

**Document ID: 12033**

# Introduction

This document provides a sample configuration for how to set up an EtherChannel between a Catalyst 3550 and a Catalyst 6500/6000 running Cisco IOS® System Software. EtherChannel could be called Fast EtherChannel or Gigabit EtherChannel, depending upon the speed of interfaces or ports used to form the EtherChannel.

**Note:** The EtherChannel commands applied to the Catalyst 3550 switch in this document can also be applied to Catalyst 3750 series switches.

# Prerequisites

## Requirements

There are no specific requirements for this document.

## Components Used

The information in this document is based on these software and hardware versions:

  • Catalyst 3550 switch running Cisco IOS® Software Release 12.1(14)EA
  • Catalyst 6500/6000 switch running Cisco IOS® Software Release 12.1(13)E1

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

## Background Theory

In this document, two Gigabit Ethernet interfaces on a Catalyst 3550 switch −− the GigabitEthernet interface on the 3500 is a 10/100/1000 negotiated Ethernet interface −− have been bundled into a Fast EtherChannel with two Fast Ethernet interfaces from a Catalyst 6500/6000 switch running Cisco IOS System Software to form a Layer 2 (L2) EtherChannel.

**Note:** In this document, Fast EtherChannel, Gigabit EtherChannel, port channel, and channel group all refer to EtherChannel.

The Catalyst switch configuration in this document applies to any Catalyst 6500/6000 or Catalyst 4500/4000 series switch running Cisco IOS System Software.

This document shows configuration files for the switches only, as well as output from the related sample **show** commands. For details on how to configure an EtherChannel, refer to these documents:

- *Configuring Layer 2 EtherChannels* section of Configuring EtherChannel (Catalyst 3550 switch)
- *Configuring Layer 3 EtherChannels* section of Configuring EtherChannel (Catalyst 3560 switch)
- *Configuring Layer 2 EtherChannels* section of Configuring EtherChannel (Catalyst 3750 switch)
- Configuring Layer 3 and Layer 2 EtherChannel (Catalyst 6500/6000 running Cisco IOS System Software)
- *Configuring Layer 2 EtherChannel* section of Understanding and Configuring EtherChannel (Catalyst 4500/4000 running Cisco IOS System Software)

## Important Notes

EtherChannel can be configured manually with the appropriate commands. You can also configure the EtherChannel automatically with Port Aggregation Protocol (PAgP) in order to have the switch negotiate the channel with the other side. For details on PAgP, refer to these documents:

- *Understanding the Port Aggregation Protocol* section of Configuring EtherChannel (Catalyst 3550 switch)
- *Understanding the Port Aggregation Protocol* section of Configuring EtherChannel (Catalyst 3560 switch)
- *Port Aggregation Protocol* section of Configuring EtherChannels (Catalyst 3750 switch)
- *Understanding the Port Aggregation Protocol* section of Configuring EtherChannel (Catalyst 6500/6000 running Cisco IOS System Software)
- *Understanding the Port Aggregation Protocol* section of Understanding and Configuring EtherChannel (Catalyst 4500/4000 running Cisco IOS System Software)

The configurations in this document are implemented with use of the desirable mode. If you plan to configure the EtherChannel manually, use the steps provided in order to create a port channel. This avoids problems with Spanning Tree Protocol (STP) during the configuration process. STP can shut down some ports, with a port status of error−disabled [errdisable], if one side is configured as a channel before the other side can be configured as a channel.

Perform these steps in order to create a port channel:

1. Leave the interfaces to be used in port channeling as administratively shutdown.
2. Create the port channel (channel group) on the Catalyst 6500/6000 switch.

   Ensure that you set the channel mode to on, for example, `channel-group 1 mode on`.
3. Create port channels on the Catalyst 3550, 3560 or 3750 switch.

   Ensure that you set the channel mode to `on`.
4. Reenable the interfaces that were disabled earlier on the Catalyst 6500/6000 switch with the **no shut** command.

# Configure

In this section, you are presented with the information to configure the features described in this document.

**Note:** To find additional information on the commands used in this document, use the Command Lookup Tool 🔗 ( registered customers only) .

## Network Diagram

This document uses the network setup shown in this diagram:

**Note:** The Gigabit Ethernet interface on the Catalyst 3550 is a 10/100/1000 Mbps negotiated Ethernet interface. The Gigabit port on the Catalyst 3550 can also be connected to a FastEthernet (100 Mbps) port on a Catalyst 6500/6000.

**Note:** The Catalyst 3750 series switches support cross−stack EtherChannel, which allows interfaces from different stack switches to be members of the same EtherChannel group. For more information on EtherChannel in a stacked switch environment, refer to the *EtherChannel and Switch Stacks* section of the Configuring EtherChannels documentation for Catalyst 3750 series switches.

## Configurations

This document uses these configurations:

- Catalyst 3550
- Catalyst 6500/6000

!
ip classless
no ip http server
!
!
!
line con 0
 transport input none
line vty 0 4
!
end
```

**Note:** This configuration example shows an EtherChannel configuration with access links. The same configuration applies to EtherChannel trunk links. Issue the **switchport mode trunk** command, or allow the switches to negotiate the mode with the **dynamic desirable** mode. For more information on how to configure trunking, refer to the *Configuring VLAN Trunks* section of the document Configuring VLANs.

# Verify

Certain **show** commands are supported by the Output Interpreter Tool <sup>⬀</sup> ( registered customers only) , which allows you to view an analysis of **show** command output.

In order to verify the port channel in Catalyst 6500/6000 and Catalyst 3500 switches running Cisco IOS System Software, issue these commands:

  - **show interfaces port−channel** *channel−group−number*
  - **show etherchannel** *channel−group−number* **summary**

In order to check the STP status in Catalyst 6500/6000 and Catalyst 3500 switches running Cisco IOS System Software, issue this command:

  - **show spanning−tree vlan** *vlan−number* **detail**

## Catalyst 3550

```
Cat3550# show interface port-channel 1
Port-channel1 is up, line protocol is up
Hardware is EtherChannel, address is 0002.4b28.db02 (bia 0002.4b28.db02)
MTU 1500 bytes, BW 200000 Kbit, DLY 1000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
 Full-duplex, 100Mb/s
input flow-control is off, output flow-control is off
 Members in this channel: Gi0/1 Gi0/2
ARP type: ARPA, ARP Timeout 04:00:00
Last input 00:03:27, output 00:00:00, output hang never
Last clearing of "show interface" counters never
Queueing strategy: fifo
Output queue 0/40, 0 drops; input queue 0/75, 0 drops
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
26 packets input, 5344 bytes, 0 no buffer
Received 17 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
```

```
0 input packets with dribble condition detected
59 packets output, 5050 bytes, 0 underruns
0 output errors, 0 collisions, 2 interface resets
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier
0 output buffer failures, 0 output buffers swapped out

Cat3550# show spanning-tree vlan 1 detail

 VLAN1 is executing the ieee compatible Spanning Tree protocol
  Bridge Identifier has priority 32768, address 0002.4b28.db01
  Configured hello time 2, max age 20, forward delay 15
  We are the root of the spanning tree
  Topology change flag not set, detected flag not set
  Number of topology changes 1 last change occurred 00:00:38 ago
          from Port-channel1
  Times:  hold 1, topology change 35, notification 2
          hello 2, max age 20, forward delay 15
  Timers: hello 0, topology change 0, notification 0, aging 0

 Port 65 (Port-channel1) of VLAN1 is forwarding
   Port path cost 12, Port priority 128, Port Identifier 128.65.
   Designated root has priority 32768, address 0002.4b28.db01
   Designated bridge has priority 32768, address 0002.4b28.db01
   Designated port id is 128.65, designated path cost 0
   Timers: message age 0, forward delay 0, hold 0
   Number of transitions to forwarding state: 1
   BPDU: sent 34, received 0

Cat3550# show etherchannel 1 summary
Flags:  D - down         P - in port-channel
        I - stand-alone  s - suspended
        R - Layer3       S - Layer2
        U - port-channel in use
Group Port-channel  Ports
-----+------------+---------------------------------------------------------
1     Po1(SU)     Gi0/1(P)  Gi0/2(P)

Cat3550# ping 10.1.1.2

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.1.1.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/4 ms
```

## Catalyst 6500/6000

```
Cat6500# show interface port-channel 1
Port-channel1 is up, line protocol is up
  Hardware is EtherChannel, address is 0002.7ef1.36e1 (bia 0002.7ef1.36e1)
  MTU 1500 bytes, BW 200000 Kbit, DLY 100 usec,
     reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Full-duplex, 100Mb/s
  Members in this channel: Fa3/1 Fa3/2
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Queueing strategy: fifo
  Output queue 0/40, 0 drops; input queue 0/2000, 0 drops
  5 minute input rate 1000 bits/sec, 1 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
     407 packets input, 34994 bytes, 0 no buffer
```

```
           Received 311 broadcasts, 0 runts, 0 giants, 0 throttles
           0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
           0 input packets with dribble condition detected
           93 packets output, 16598 bytes, 0 underruns
           0 output errors, 0 collisions, 0 interface resets
           0 babbles, 0 late collision, 0 deferred
